

Comparing **SD-WAN, SD-WAN 1.0, and SD-WAN 2.0**

Deciding between the best networking tools in the industry - including SD-WAN, SD-WAN 1.0, and SD-WAN 2.0 - can result in confusion. Especially when you think their similar names indicate similar functions.

Knowing the difference between each solution and how each can help your enterprise will enable you to make the decision that will best improve your network.

SD-WAN

Known as a network enhancer, SD-WAN overlays existing technology that requires additional resources to make it a comprehensive solution.

Unlike more advanced versions, many SD-WANs don't allow businesses to manage the WAN or LAN aspects of cyber security.

SD-WAN 1.0

For businesses with existing firewalls, SD-WAN 1.0 is a perfectly good option. This solution is ideal for businesses that are not ready to make the leap to SD-WAN 2.0, but want the benefits of SD-WAN.

SD-WAN 1.0 sits in front of your own firewall, improving your internet experience.

SD-WAN 2.0

Morphed into an all-in-one solution through a convergence of different technologies, SD-WAN 2.0 is the next-generation technology that encompasses the full package and allows businesses to easily manage their networks with true cyber security.

With SD-WAN 2.0, businesses get the network tools they need to gain visibility into LANs.

SD-WAN 2.0 is simple, highly connected, and secure. With services including VoIP, multi-location networking, diagnostics, and more, SD-WAN 2.0 is the networking solution for the enterprise of the future.

- An easy-to-use portal
- Managed wifi
- Compliance
- Firewall
- Threat intelligence
- Cyber Security
- and more

Thinking SD-WAN 2.0 Is the Way to Go?

If you're looking for an all-in-one solution that will provide your business with the industry's latest networking tools, call SimpleWAN at **(855) 438-2926** or email at **info@SimpleWAN.com**. Our team of experts will help you get started, ensuring you get the real SD-WAN.
