

# WHAT IS VPN? & WHY YOU NEED ONE

"A VPN (Virtual Private Network) is an encrypted tunnel that keeps your data secure and anonymous."

## ACCESS REGIONAL RESTRICTED STREAMING CONTENT

A VPN allows you to connect to any country server, while traveling abroad, so your streaming service thinks you're still local and lets you watch your favorite shows.

## USE PUBLIC WIFI SAFELY

Unfortunately, with so many strangers crammed into one place, it also makes the public WiFi a "hot zone" for identity theft and vulnerabilities. If you want to secure your self on public WiFi, then you really ought to get a VPN, too.

## HIDE YOUR IP ADDRESS

Your ISP has the complete access to your internet data. With the help of VPN service strong protocols, you can avoid this kind of surveillance

## STAY ANONYMOUS ONLINE

If you want all of your online activity to be anonymous, the best way to do it is to pretend to be someone else. By changing your IP you can pretend to be someone else and stop your ISP and government from accessing your actual location.

## ACCESS BLOCKED WEBSITES

Some social media websites are blocked in many countries like Facebook, Twitter and VK. VPN let you access all of these websites in the respective countries with ease.
