

ARE YOU SECURE ONLINE?

HOW A VPN CAN HELP SECURE YOU ONLINE

PERCEPTION VS REALITY OF ONLINE SECURITY

In a survey taken in the U.S., only 18% of users believed their personal data to be somewhat or very insecure online.

Legend:
■ -somewhat or very secure
■ -neither secure nor insecure
■ -somewhat or very insecure

But data shows we may not be as secure online as we think as shown in the survey below on data theft in the U.S.

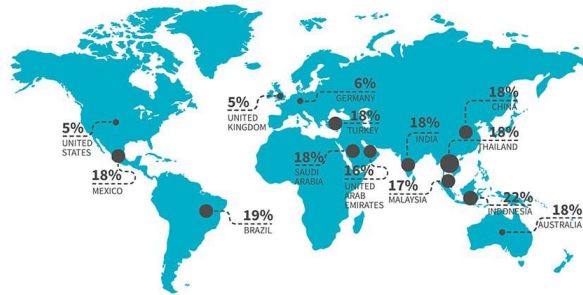

In a recent survey, 64% of adults in the US say they have experienced some form of data theft.

GLOBAL VPN USAGE

Only 9% of internet users in the US secure their internet activity.

While many online users understand the need for online security, very few users around the globe, especially in the West where privacy is highly valued, use a VPN.

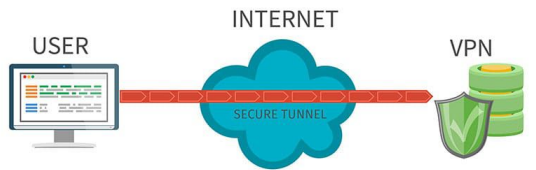

WHAT IS A VPN AND HOW DOES IT WORK?

VPN stands for "virtual private network."

A VPN is a technology that creates an encrypted, private connection on a public network so that data can be sent and received securely.

These encrypted connections are most important on public networks like coffee shops, airports and restaurants, where most data theft happens.

OTHER USES FOR A VPN

Apart from online security, there are valuable uses for a VPN. Here is the percentage of PC users who use a VPN for reasons other than security.
